PEROMONE COMMUNICATION IN MOTHS SENSORY PHYSIOLOGY AND ... This chapter discusses pheromone communication in moths with an emphasis on female sex pheromones. Male courtship pheromones are widely distributed in most lepidopteran groups, including butterflies, and differ largely from the female pheromones by their chemical composition, biosynthesis, and dissemination mechanisms. Pheromone Communication in Moths : Evolution, Behavior ... Pheromone Communication in Moths is an invaluable resource for entomologists, chemical ecologists, pest-management scientists, and professionals who study pheromone communication and pest management. Communication - Butterflies and Moths The antennae of moths are quite variable, especially the antennae of male moths are often well developed. The antennae of male moths contain sense organs which can detect the species specific pheromones produced by a receptive female.

Pheromone Communication in Moths: Evolution, Behavior, and ... Pheromone Communication in Moths: Evolution, Behavior, and Application by Jeremy D. Allison Common among moths is a mate-finding system in which females emit a pheromone that induces males to fly upwind along the pheromone plume. Pheromone Communication in Moths and Butterflies ... Our interest is to gain an understanding of communication in the form of exchange of biologically meaningful signals between conspecifics (Schneider, 1965; Wilson, 1970) in moths and butterflies. Originally it was assumed that pheromones are species-specific, that is, each species produced, for example, its own sexual attractant. Pheromone communication channels in tortricid moths: lower ... Discrimination of conspecific and heterospecific signals is a key element in the evolution of specific mate recognition systems. Lepidopteran pheromone signals are typically composed of several compounds that synergize attraction of conspecific and inhibit attraction of heterospecific males.
